

ABSTRACT OF THE DISCLOSURE

A candle having a wick surrounded by a solid fuel body. At least an upper fuel region of the solid fuel body has a first melting point and a lower fuel region of the solid fuel body has a second melting point at a lower temperature than the first melting point.

- 5 The lower fuel region of the solid fuel body is positioned below the wick for extinguishing the candle. The method for making an anti-flash candle includes forming a void in the upper fuel region and filling the void with lower melting point wax.
